Kinsmen

See the whole journey.

A visitor can understand the system in one quick flow.

1

SCAN

Open the live site

2

BOOK

Choose a service, barber and time

3

RESERVE

Add products for collection

PAY IN STORE • NO ONLINE CHECKOUT CLAIMED

The system checks before it books.

1

RIGHT BARBER

Only a barber with the required skill is offered.

2

RIGHT TIME

Booked slots and blocked time are excluded.

3

RIGHT PRICE

The API uses current catalogue values, not browser totals.

A booking can hold a product.

The shop is for in-store collection. It helps staff see stock before the customer arrives.

Available

Can be reserved with a booking

Low stock

Staff can see a warning level

Cancelled booking

Reserved stock is returned

Kinsmen

Built for the whole shop.

Books, manages appointments and reserves products.

CUSTOMER

Sees assigned work, confirms appointments and blocks time.

BARBER

Manages services, skills, products, stock and dashboard data.

ADMIN

Kinsmen

Small shop. Serious system.

1. **Auth0**
   Secure sign-in and roles

2. **Kinsmen Web**
   Customer, barber and admin pages

3. **Kinsmen API**
   Booking and stock rules

4. **MongoDB Atlas**
   Shared bookings and products

Docker + Render + GitHub Actions help the team build, test and deploy.

Kinsmen

Ask us about...

01 How does it stop a double booking?

02 What happens to product stock when a booking is cancelled?

03 How does the app know which barber can do a service?

04 Why does the browser not talk directly to the database?

We can show you the live system or walk through the architecture.
